Showing just the information needed at the right time and place can be crucial in helping people achieve their goals as quickly and easily as possible. Determining the right way to progressively disclose information can be challenging but can really help your visualization designs.  What was the visual exaggeration in Florence Nightingales¹ "rose diagram"?  The areas of the wedges  Line lengths  The color choices  Correct  The areas of the wedges are an artifact of the visualization type and exaggerate the actual differences in the data.  Which of the following is not an example of a useful coordinated view approach?	Real time streaming of data.	
<ul> <li>The areas of the wedges</li> <li>Line lengths</li> <li>The color choices</li> <li>✓ Correct         The areas of the wedges are an artifact of the visualization type and exaggerate the actual differences in the data.     </li> <li>Which of the following is not an example of a useful coordinated view approach?</li> <li>Filtering</li> </ul>	Showing just the information needed at the right time and place can be crucial in helping people achieve their goals as quickly and easily as possible. Determining the right way to progressively disclose	2
<ul> <li>The areas of the wedges</li> <li>Line lengths</li> <li>The color choices</li> <li>✓ Correct         The areas of the wedges are an artifact of the visualization type and exaggerate the actual differences in the data.     </li> <li>Which of the following is not an example of a useful coordinated view approach?</li> <li>Filtering</li> </ul>		
Une lengths  ○ The color choices  ✓ Correct  The areas of the wedges are an artifact of the visualization type and exaggerate the actual differences in the data.  Which of the following is not an example of a useful coordinated view approach?	What was the visual exaggeration in Florence Nightingales' "rose diagram"?	1/1 point
<ul> <li>○ The color choices</li> <li>✓ Correct         The areas of the wedges are an artifact of the visualization type and exaggerate the actual differences in the data.     </li> <li>Which of the following is not an example of a useful coordinated view approach?</li> <li>1/1 point</li> <li>○ Filtering</li> </ul>		
✓ Correct  The areas of the wedges are an artifact of the visualization type and exaggerate the actual differences in the data.  Which of the following is not an example of a useful coordinated view approach?		
The areas of the wedges are an artifact of the visualization type and exaggerate the actual differences in the data.  Which of the following is not an example of a useful coordinated view approach?  Filtering	O The color choices	
Filtering	The areas of the wedges are an artifact of the visualization type and exaggerate the actual	
O Filtering		
	Which of the following is not an example of a useful coordinated view approach?	1/1 point
Distorting	○ Filtering	
	<ul><li>Distorting</li></ul>	

Coordinated highlighting and filtering can help viewers more effectively and directly interact with a data set and can provide more perspective about what they are seeing. Distorting the data is something that your visualizations won't do, right?;-)

7. Which of the following is not true about discrete data?

1/1 point

There's no inherent order to the categories.	
Discrete data have a potentially infinite set of values.	
The values are not subdivided.	
✓ Correct Discrete data fall into defined categories or bins. Think apples and oranges – there's not meaningful	
range or continuum between the two types of fruit.	
8. Which two visual attributes are good for displaying quantitative measures?	1/1 point
Line length and 2D position	
Color intensity and saturation Shape and size	
O Shape and size	
Correct  It is relatively easy to make precise quantitative comparisons with line lengths or the position of a dot, but nearly impossible to make a precise quantitative assessment with something like color intensity. For example, can a red and a slightly darker red be used effectively to show a precise numerical comparison between two measures?	
9. What's a common design problem for direct manipulation of graphical objects?	1/1 point
<ul> <li>A target area for selection is covered up or crowded out by other graphical objects.</li> </ul>	
Users tend to preferentially select rectangular shapes.	
Graphical objects may appear closer than they really are.	
✓ Correct	
The ability to directly interact with graphical objects in a visualization can be very useful, but be mindful about potentially creating situations in which users have a difficult or frustrating time selecting the intended object.	
mended object.	
10. Why is it generally a good idea to start axes with a zero?	1/1 point
Charts look better with axes starting at zero.	
It's always easier to design charts that way.	
It avoids distortions in the values being compared.	
✓ Correct  Without starting at zero, it's all too easy to present incomplete and misleading comparisons among   Output  Description:  Output  Des	
different measure.	
11. Which of the following is not generally considered an essential element of a useful Persona description?	1/1 point
The persona's needs	
O The persona's goals	
The persona's pets' names	
✓ Correct	
A key part of the persona description is a list of need and goals. These help set priorities and focus the design. Adding some details like a persona's pet name can, in some instances, be helpful in breathing life into a persona and making them believable and relatable, but typically they are not an essential element.	
12. Which visual attribute is good for displaying qualitative measures?	1/1 point
O 2D Position	
C Line length	
Color intensity	
✓ Correct	
Color intensity can be very effective at conveying a qualitative sense of activity with a darker, more saturated color indicating higher activity, and a lighter, less saturated color showing lower activity.	
13. Which definition best fits the idea of "survivor bias"?	1/1 point
A tendency to draw conclusions based on data from biased survivors.	
A tendency to draw conclusions based only on data that survived the ETL process.	
A tendency to draw conclusions based on data from what survived a process and overlooking what did not.	
✓ Correct It's natural to think about the data collected for things that "survived" a process and overlook the	
data for things that did not survive the process.	
14. True/False: Tree maps are an example of Geospatial representation?	1 / 1 point
False	
O True	
✓ Correct	
¥	

Tree maps are best for showing part-to-whole relationships. They are an abstracted way of showing hierarchies in a compact format.
